

Example Triathlon S&C Mini Workouts

Below are three example workouts which can be completed alongside your triathlon training to build strength, stability and mobility to compliment the running component of your triathlon training. The goal here is to keep you running injury free.

There are of course literally hundreds of exercises available to choose from, and each runner will need to address a certain different 'weak link'. This is far from an exhaustive plan, but gives you a good basis upon which to structure your strength and mobility training.

Please refer to this article for advice on how and when to implement the workouts in your training week:
